

by the Mainstream Media

The mainstream media is engaged in what

we Americans call “bald faced lies” about swine flu. It seems to be true with this issue more than any other, and it became apparent to me recently when a colleague of mine — a nationally-syndicated newspaper columnist — told me their column on natural defenses for swine flu was rejected by newspapers all across the country. Many newspapers refused to run the column and, instead, ran an ad for “free vaccine clinics” in the same space.

The media, it seems, is so deeply in bed with the culture of vaccinations that they will do almost anything to keep the public misinformed. And that includes lying about [swine flu vaccines](#).

There are ten key lies that continue to be told by the [mainstream media](#) (MSM) about swine flu and swine [flu vaccines](#).

Lie #1 - There are no adjuvants used in the vaccines

I was recently being interviewed by a major U.S. news network when the reporter interviewing me came up with this humdinger: There are *no adjuvants* being used in the swine flu vaccines, he said!

I assured him that adjuvants were, indeed, a crucial part of the vaccine recipe, and they were being widely used by drug companies to “stretch” the vaccine supply. It’s no secret. But he insisted he had been directly told by a drug company rep that no adjuvants were being used at all. And he believed them! So everything being published by this large news network about swine flu vaccines now assumes there are no adjuvants in the vaccines at all.

Lie #2 - The swine flu is more dangerous than seasonal flu

This lie is finally starting to unravel. I admit that in the early days of this pandemic, even I was concerned this could be a global killer. But after observing the very mild impact the virus was having on people in the real world, it became obvious that this was a mild flu, no more dangerous than a seasonal flu.

The MSM, however, continues to promote H1N1 swine flu as being super dangerous, driving fear into the minds of people and encouraging them to rush out and get a vaccine shot for a flu that’s really no more likely to kill them than the regular winter sniffles. Sure, the virus could still mutate into something far worse, but if it does that, the current vaccine could be rendered obsolete anyway!

Lie #3 - Vaccines protect you from swine flu

This is the biggest lie of all, and the media pushes it hard. Getting a vaccine, they insist, will protect you from the swine flu. But it’s just flat-out false. Even if the vaccine produces antibodies, that’s not the same thing as real-world immunity from a live virus, **especially if the virus mutates** (as they often do).

As I pointed out in a recent article, statistically speaking the average American is *40 times more likely to be struck by lightning* than to have their life saved by a swine flu vaccine. (http://www.naturalnews.com/026955_s...) ([περισσότερα...](#))
