Top 10 Beautiful Snow Animals

Ξένες γλώσσες / In English

Animals that live in the Arctic (either full time or seasonally) are adapted to extreme conditions. Many animals who overwinter in the Arctic (like the Arctic fox and the ermine) have a coat that thickens and changes color to white during the winter as camouflage in the snow

Arctic wolves are of the largest of the subspecies of the gray wolf. Their bodies are heavier set and are not as tall and lanky looking as some other subspecies. Arctic wolves have adapted very well to the icy environment where they live. They have white fur, which allows them to blend into their snowy surroundings. To help reduce heat loss, they have more-rounded ears, a shorter muzzle and shorter legs than other gray wolf subspecies. They also have hair between the pads of their feet and long, thick fur to keep them warm in temperatures that can drop to minus 70° Fahrenheit. Arctic wolves live primarily in the Arctic, the region located above 67° north latitude. The land is covered with snow and ice for most of the year.
